Lab — Text Files, Pickling

Preliminary

Download the short poem "Tarantella" (D.H. Lawrence, 1916) found here. Make sure the file is located in the same directory as your lab Python file.

Task 1 — Line count

Using a Python program, determine how many lines (not including title) are in this poem.

Task 2 — Word count

Using a Python program, determine how many words (not including title) are in the poem.

(You will most likely want to use a combination of `split()` and `replace()` to accomplish this task.)

Task 3 — Reminders

Write a Python program which prompts the user to enter reminders. Allow the user to provide multiple items and have a way for the user to say they are done adding items.

Here is a sample (straightforward) program run:

```
Enter a reminder. (Enter 'n' if done.)
brush teeth
```

```
Enter a reminder. (Enter 'n' if done.)
walk dog
Enter a reminder. (Enter 'n' if done.)
study Python
Enter a reminder. (Enter 'n' if done.)
n

Here are your reminders:
brush teeth
walk dog
study Python
```

Task 4 — Better Reminders

The program in Task 3 is not super useful because as soon as the program terminates the information stored vanishes. Using `Pickle`, allow the user to retrieve reminders (if they exist). When the program first starts it should output the previous reminders.

If previous reminders don't exist, save the current reminders to a file.

Deliverable

- Submit your commented code. (Brief comments are okay. If you got stuck, please provide a more detailed summary.)
- Provide screenshots of your code in action.
- Use Canvas to submit your code and screenshots.
